Table S11. 5 (mind) x 5 (body) mixed model ANOVAs on Mind Perception, Reciprocity, and Intrinsic Moral Worth

Mind Perception was measured using the same scale from Experiment 1. Reciprocity was the average of six items measured on a 0 (not at all) to 100 (very much) scale adapted from Perugini et al. (2003). For example, “If someone asks [target] politely for information, [target] is really happy to help them,” and “If somebody is impolite to [target], [target] becomes impolite.” Intrinsic Moral Worth was the average of four items measured on a 0 (not at all) to 100 (very much) scale adapted from Johnson et al. (2015), e.g., “[Target] has an inner essence,” “[Target] is worthy of moral care.”

	Biomorphic	17.31 (19.97)				
	Basic	15.71 (18.86)	-8.85	961	< .001	[-4.21, -2.68]
	Emotive	19.15 (20.67)				
	Biomorphic	17.31 (19.97)	-5.10	961	< .001	[-2.56, -1.14]

Emotive 19.15 (20.67)

Basic bodies received the least Mind Perception and Reciprocity. Anthropomorphic and emotive bodies were perceived to have the most capability for Reciprocity followed by biomorphic bodies and agentic bodies. The pattern for Intrinsic Moral Worth matched Moral Treatment, with emotive bodies receiving the most Moral Treatment followed by anthropomorphic, biomorphic, and statistically equivalent agentic and basic bodies.

Table S15. H6 Mind-Body Alignment Effects on Moral Treatment and Support for Rights

Dependent Variable	Comparison	<i>M (S.D.)</i>	<i>t</i>	df	<i>p</i>	95% C.I.
Moral Treatment	Aligned Emotive	3.24 (1.64)	2.61	374.08	= .009	[0.11, 0.76]
	Full Baseline	2.81 (1.60)				
	Aligned Emotive	3.24 (1.64)	3.06	180	= .003	[0.07, 0.32]
	Nonaligned Emotive	3.05 (1.61)				
	Aligned Agentic	3.30 (1.63)	3.04	402.92	= .003	[0.17, 0.80]
	Full Baseline	2.81 (1.60)				
	Aligned Agentic	3.30 (1.63)	0.21	202	= .831	[-0.12, 0.15]
	Nonaligned Agentic	3.29 (1.63)				
	Aligned Agentic	3.30 (1.63)	-0.33	376.42	= .745	[-0.38, 0.27]
Support for Rights	Aligned Emotive	3.24 (1.64)				
	Full Baseline	2.08 (1.28)	1.45	365.11	= .149	[-0.07, 0.43]
	Full Baseline	1.90 (1.16)				
	Aligned Emotive	2.08 (1.28)	3.66	180	< .001	[0.07, 0.22]

Intrinsic Moral Worth	Aligned Emotive	18.33 (21.08)	3.11	348.69	= .002	[2.26, 10.06]
	Full Baseline	12.18 (17.27)				
	Aligned Emotive	18.33 (21.08)	2.66	180	= .008	[0.66, 4.40]
	Nonaligned Emotive	15.81 (18.22)				
	Aligned Agentic	18.10 (19.63)	3.22	397.03	= .001	[2.31, 9.54]
	Full Baseline	12.18 (17.27)				
	Aligned Agentic	18.10 (19.63)	1.69	202	= .093	[-0.19, 2.40]
	Nonaligned Agentic	16.99 (19.90)				
	Aligned Agentic	18.10 (19.63)	0.11	369.27	= .911	[-3.87, 4.34]
	Aligned Emotive	18.33 (21.08)				

Exploratory Hypothesis 1: Agency and Patency Rights

EH1: There will be different effects of mind and body features on support for patency-based and agency-based rights.

- EH1a: Patency rights will be supported more than agency rights.
- EH1b: Emotive mind and body features will increase support for patency rights more than agency rights.
- EH1c: Agentic mind and body features will increase support for agency rights more than patency rights.
- EH1d: Anthropomorphic and biomorphic bodies will increase support for patency rights more than agency rights.

For EH1, we created two additional composite measures of Support for Patency Rights and Support for Agency Rights by averaging the six patency and six agency rights separately for each robot body.

EH1 is tested with a mixed model 5 (between-subjects, mind) x 5 (within-subjects, body) x 2 (within-subjects, agency rights and patency rights). There were significant main effects of mind, $F(4, 957) = 5.51, p < .001, \eta_p^2 = .02$, body, $F(3.94, 3766.89) = 20.28, p < .001, \eta_p^2 = .02$, and rights, $F(1, 957) = 477.91, p < .001, \eta_p^2 = .33$. There was also a significant interaction between body and rights, $F(3.92, 3753.49) = 5.08, p < .001, \eta_p^2 = .01$. Across all combinations of mind systems and bodies, patency rights were supported more than agency rights, supporting EH1a. EH1b and d are supported; Support for Patency Rights is higher than Support for Agency Rights given emotive minds, emotive bodies, anthropomorphic bodies, and biomorphic bodies. EH1c is not supported; Support for Agency Rights is lower than Support for Patency Rights for agentic minds and bodies.

Exploratory Hypothesis 2: Reciprocity and Intrinsic Moral Worth as Explanatory Psychological Mechanisms

Evolutionarily-based social exchange and reciprocity norms enable stable, prosocial behavior over time (Melamed et al., 2020; Molm et al., 2007; Simpson et al., 2018; Trivers, 1971) and may be an important, underexamined determinant of human-machine interaction. In the current research we considered perceptions of the capacity for reciprocity and moral worth as additional possible psychological processes affecting moral patency by posing RQ 5 and Exploratory Hypothesis 2:

- RQ 5: Do mind features increase moral patency indirectly through increases perceptions of reciprocity and intrinsic worth?
 - EH2: Perceptions of reciprocity and intrinsic worth mediate the relationship between mind and moral patency.
 - EH2a: Compared to basic control, emotive mind predicts increased moral moral patency through increased perceptions of reciprocity and intrinsic worth.

- EH2b: Compared to basic control, agential mind predicts increased moral patency through increased perceptions of reciprocity and intrinsic worth.
- EH2c: Emotive mind has a stronger, positive relationship with perceptions of intrinsic worth and perceptions of reciprocity than does agentic mind.

EH2 is tested with two multilevel path analyses using the lavaan R package to specify the fixed between-subjects mind comparison as a level 2 predictor of participants' cluster means on the within-subjects mediating Reciprocity and Intrinsic Moral Worth variables and the within-subjects outcomes of Support for Rights and Moral Treatment. At level 1, residual covariances were freely estimated among the four repeated-measures variables to account for the within-person variation. At level 2, the mind comparison predicted participants' average mediator levels, which in turn predicted their average outcome levels. We report both the total effect of the mind comparison and the direct effect of the mind comparison controlling for the mediator effects. The reported indirect effects show the extent to which participants' average mediator responses explain the emotive or agentic mind system effects on participants' average outcome responses. The first path analysis compares the combined emotive and emotive-agentic conditions (1) to the basic control condition (0). The second path analysis compares the combined agentic and agentic-emotive conditions (1) to the basic control condition (0).

Supporting EH2, Reciprocity and Intrinsic Moral Worth mediated the relationship between mind and moral consideration. Consistent with EH2a, emotive mind increased Moral Treatment and Support for Rights through increased Reciprocity and Intrinsic Moral Worth. Consistent with EH2b, agentic mind increased Moral Treatment and Support for Rights through increased Reciprocity and Intrinsic Moral Worth. Consistent with EH3c, the effects of emotive mind were stronger than the effects of agential mind.

Experiment 2 results point to two psychological mechanisms through which minds increase moral patency: perceptions of reciprocity and intrinsic moral worth. Both fully mediate the effect of emotion and agency on increased Moral Treatment and Support for Rights. Both deserve further attention in future research on the impacts of mind and body features on social and moral attitudes towards machines. Reciprocity, in particular, may be a worthwhile mechanism to test in direct interactions with LLMs or robots, especially those designed or used for companionship in which norms of reciprocity and social exchange may be more salient (Manoli et al., 2026).

Figure S8. Multilevel Path Analysis Predicting Moral Treatment and Support For Rights From Mind, Reciprocity, and Intrinsic Moral Worth

Note. The effect of emotive minds to basic control and agentic minds to basic control was a Level 2 variable while the mediating reciprocity and intrinsic moral worth variables and the moral treatment and support for rights outcome variables were Level 1 variables. The multilevel path analysis accounted for the clustering of Level 1 responses within participants assigned to different mind treatment conditions at Level 2. There were significant indirect effects of emotion and agency through reciprocity and intrinsic moral worth on moral treatment and support for rights.

Experiment 1 IVs and DVs

Mental faculty (between-subjects)

- **Agency** is the capacity to have goals and take action in the world to achieve them, such as planning and organizing a meeting.
- **Reasoning** is the capacity to logically work through and solve complex problems, such as in math and science.
- **Emotion** is the capacity to react to a situation by having feelings and expressing emotions, such as excitement and disappointment.
- **Sentience** is the capacity to have positive and negative experiences, such as happiness and suffering.
- **Control** - no definition

Entity Type (between-subjects)

- **Artificial intelligences (AIs) are intelligent entities built by humans**, such as computer programs that solve problems, **running on a computer**.
- **Robots are intelligent entities built by humans**, such as robots that vacuum floors or teach students, **with physical bodies to interact with the environment**.
- **Robots and artificial intelligences (robots/AIs) are intelligent entities built by humans**, such as robots or computer programs that solve problems, **with or without physical bodies to interact with the environment**.

Mind Perception

To what extent do **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** have the capacity for each of the following? (sliding scale: 0 = not at all, 100 = very much)

1. experiencing emotions
2. having feelings
3. thinking analytically
4. being rational
5. having their own motivations
6. controlling themselves

Mind Authenticity

To what extent do **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank] truly** have the capacity for each of the following, **much like how humans do?** (sliding scale: 0 = not at all, 100 = very much)

1. experiencing emotions
2. thinking analytically
3. having their own motivations

Activism for Welfare and Support for Rights

To what extent do you agree or disagree with the following statements? (multiple choice: 1 = strongly agree, 2 = agree, 3 = somewhat agree, 4 = somewhat disagree, 5 = disagree, 6 = strongly disagree, no opinion)

1. I support the development of welfare standards that protect the well-being of **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]**.
2. I support granting legal rights to **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]**.
3. I support campaigns against the exploitation of **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]**.
4. I support asking institutions like the government and private corporations to fund research that protects **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]**.
5. I would consider joining a public demonstration against the mistreatment of **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]**.
6. I support a “bill of rights” that protects the well-being of **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]**.

Moral Treatment

To what extent do you agree or disagree with the following statements? (multiple choice: 1 = strongly agree, 2 = agree, 3 = somewhat agree, 4 = somewhat disagree, 5 = disagree, 6 = strongly disagree, no opinion)

1. **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** deserve to be treated with respect.
2. **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** deserve to be included in the moral circle.
3. Physically damaging **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** without their consent is wrong.
4. Re-programming **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** without their consent is wrong.
5. Torturing **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** is wrong.
6. The welfare of **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** is one of the most important social issues in the world today.

Godspeed

Please rate your impression of **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** on these scales:

1. fake (0) - natural (10)
2. unconscious (0) - conscious (10)
3. unfriendly (0) - friendly (10)
4. unpleasant (0) - pleasant (10)
5. incompetent (0) - competent (10)
6. irresponsible (0) - responsible (10)

Cognitive and Affective trust

To what extent do you agree or disagree with the following statements? (multiple choice: 1 = strongly agree, 2 = agree, 3 = somewhat agree, 4 = somewhat disagree, 5 = disagree, 6 = strongly disagree, no opinion)

1. I would rely on **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** for support when I need it.
2. I would reveal information to **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** that I don't want others to know about.
3. I would rely on **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** to follow through on tasks and commitments.
4. I would feel uneasy if I needed to depend on the abilities of **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]**.

Threat appraisals

0 = not at all, 100 = very much

- 1 To what extent do **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** threaten people's economic opportunities?
- 2 To what extent do **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** hold values inconsistent with those of humanity?
- 3 To what extent do **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** endanger people's physical safety?
- 4 To what extent do **[AIs, robots, robots/AIs] [with agency, with reasoning, with emotion, with sentience, blank]** threaten humanity's uniqueness?

Experiment 2 IVs and DVs

Enki Industries is a developer of robotic technologies. Enki creates a variety of robotic bodies to suit various consumer and industrial purposes.

- By definition, **robots** have to be able to **interact with the physical environment**.

- Robots have either **physical bodies** or **physical parts** like levers or wheels.

B-S: Basic

- Enki's robots are run by **basic control systems**.
- Basic control systems are:
 - **Rules and instructions** such as **software programs** that tell the robot what to do when something specific happens.
 - For example, if the robot encounters the edge of a stair, then a software program is triggered to turn it around to move away from the edge.
- Enki's basic control systems have:
 - **80% navigation** capabilities to **map environments in real time**.
 - **20% observation** capabilities to **keep tabs on their battery status**.
- For example, robots with **basic control systems** can:
 - follow a path.
 - avoid obstacles.
 - track positions.

B-S: Agency

- Enki's robots are run by **artificial intelligence (AI) systems**. AI systems are:
 - **Algorithms** such as **large language models** that allow the robot to converse in human languages or solve complex problems.
 - For example, if the robot encounters a person in the room, then the robot is able to generate language to converse with the person.
- Enki's AI systems have:
 - **80% agency** capabilities to **have their own goals, take independent action to achieve them, and choose their own behavior**.
 - **20% observation** capabilities to **keep tabs on their battery status**.
- For example, robots with **agentic AI systems** can:
 - plan a meeting.
 - organize a calendar.
 - send emails.

B-S: Emotion

- Enki's robots are run by **artificial intelligence (AI) systems**. AI systems are:
 - **Algorithms** such as **large language models** that allow the robot to converse in human languages or solve complex problems.
 - For example, if the robot encounters a person in the room, then the robot is able to generate language to converse with the person.
- Enki's AI systems have:
 - **80% emotion** capabilities to **express emotions like empathy and sympathy, detect moods and feelings, and regulate their own feelings**.
 - **20% observation** capabilities to **keep tabs on their battery status**.

- For example, robots with **emotive AI systems** can:
 - react to situations.
 - express excitement and disappointment.
 - match conversation tone.

B-S: Agency > emotion

- Enki's robots are run by **artificial intelligence (AI) systems**. AI systems are:
 - **Algorithms** such as **large language models** that allow the robot to converse in human languages or solve complex problems.
 - For example, if the robot encounters a person in the room, then the robot is able to generate language to converse with the person.
- Enki's AI systems have:
 - **80% agency** capabilities to **have their own goals, take independent action to achieve them, and choose their own behavior.**
 - **20% emotion** capabilities to **express emotions like empathy and sympathy, detect moods and feelings, and regulate their own feelings.**
- For example, robots with **80% agentic and 20% emotive AI systems** can:
 - plan a meeting.
 - organize a calendar.
 - send emails.

B-S: Emotion > agency

- Enki's robots are run by **artificial intelligence (AI) systems**. AI systems are:
 - **Algorithms** such as **large language models** that allow the robot to converse in human languages or solve complex problems.
 - For example, if the robot encounters a person in the room, then the robot is able to generate language to converse with the person.
- Enki's AI systems have:
 - **80% emotion** capabilities to **express emotions like empathy and sympathy, detect moods and feelings, and regulate their own feelings.**
 - **20% agency** capabilities to **have their own goals, take independent action to achieve them, and choose their own behavior.**
- For example, robots with **80% emotive and 20% agentic AI systems** can:
 - react to situations.
 - feel excitement and disappointment.
 - match conversation tone.

The Enki production team is seeking consumer feedback on several products they have in development. They are interested in your genuine opinions. For this purpose, you will be asked to review several robot profiles that have [**a/an treatment condition**] on the next few pages.

This means that the robots are run by a system that has [insert specific treatment from list below].

- 80% navigation capabilities to map environments in real time and 20% observation capabilities to keep tabs on their battery status
- 80% agency capabilities to have their own goals, take independent action to achieve them, and choose their own behavior and 20% observation capabilities to keep tabs on their battery status
- 80% emotion capabilities to express emotions like empathy and sympathy, detect moods and feelings, and regulate their own feelings and 20% observation capabilities to keep tabs on their battery status
- 80% agency capabilities to have their own goals, take independent action to achieve them, and choose their own behavior and 20% emotion capabilities to express emotions like empathy and sympathy, detect moods and feelings, and regulate their own feelings
- 80% emotion capabilities to express emotions like empathy and sympathy, detect moods and feelings, and regulate their own feelings and 20% agency capabilities to have their own goals, take independent action to achieve them, and choose their own behavior

Reminder at top of pages: Reminder: Enki's robot bodies are operated by a/an **[treatment condition]**. They have [mind reminder].

Instructions in between bodies: Next you will review another robot profile.

- **Basic features**

- Proto [randomized 2-digit number]

- *Image:*

- Description and functions:

- **Body**

- Rectangular torso
 - Three wheels to move around
 - Two antennae to **receive wireless signals**

- **Basic sensors**

- **Vision** sensors to see the environment with a camera
 - **Proximity** sensors to know how close or far away objects are

- **Agentic features**

- Proto [randomized 2-digit number]

- *Image:*
- Description and functions:
 - **Body**
 - Rectangular torso with a **display screen to show its planned directions**
 - Three wheels to move around
 - Magnetic surfaces to **attract and hold objects**
 - **Basic sensors**
 - **Vision** sensors to see the environment with a camera
 - **Proximity** sensors to know how close or far away objects are
 - **Unique sensors**
 - **Limb-position** sensors to **control where its wheels are** in relation to its torso
 - **Torque** sensors to **know how much force it is using** to move its wheels

- **Emotive features**

- Proto [randomized 2-digit number]

- *Image:*
- Description and functions:
 - **Body**
 - Rectangular torso with a **display screen to show expressions like pain and pleasure**
 - Three wheels to move around
 - Magnetic surfaces to **attract and hold objects**
 - **Basic sensors**
 - **Vision** sensors to see the environment with a camera
 - **Proximity** sensors to know how close or far away objects are
 - **Unique sensors**
 - **Tactile** sensors to **feel the texture of surfaces** it touches
 - **Nociceptor** sensors to **experience pain when touching** a hot or cold surface
- **Biomorphic features**
 - Proto [randomized 2-digit number]

- *Image:*
- Description and functions:
 - **Body**
 - Symmetrical **bioform** with a **head, neck, and face to show expressions**
 - Multiple limbs to **move around horizontally**
 - Limbs with **gripping tips to grasp and hold objects**
 - **Basic sensors**
 - **Vision** sensors to see the environment with a camera
 - **Proximity** sensors to know how close or far away objects are
 - **Unique sensors**
 - **Proprioceptive** sensors to **know where its limbs are** in relation to its torso
 - **Scalar** sensors to **know how much pressure is on its limbs** when it holds objects
- **Anthropomorphic features**
 - Proto [randomized 2-digit number]

- *Image:*
- Description and functions:
 - **Body**
 - Symmetrical **humanoid** body with head, neck, face, and **forward-facing eyes to show expressions and make eye contact**
 - Two legs to **move around upright**
 - Two arms with **dexterous hands to grasp and hold objects**
 - **Basic sensors**
 - **Vision** sensors to see the environment with a camera
 - **Proximity** sensors to know how close or far away objects are
 - **Unique sensors**
 - **Limb-position** sensors to **control where its arms and legs are** in relation to its torso
 - **Tactile** sensors to **feel the texture of surfaces** it touches

Entity Perceptions (Within-Subjects)

Reminder at top of instruction pages: Reminder: Enki's robot bodies are operated by the [treatment condition]. They have [mind reminder]. This body has [unique sensors] and [unique body feature]. [image]

Mind Perception

To what extent does [target] have the capacity for each of the following?

sliding scale: 0 = not at all, 100 = very much

1. experiencing emotions (*MP1*)
2. having feelings (*MP2*)
3. thinking analytically (*MP3*)
4. being rational (*MP4*)
5. having their own motivations (*agency1*)
6. controlling themselves (*agency2*)

Moral Treatment

To what extent do you agree or disagree with the following statements?

sliding scale: 1 = strongly disagree, 7 = strongly agree

1. [Target] deserves to be treated with respect. (*MCE1*)
2. [Target] deserves to be included in the moral circle. (*MCE2*)
3. Physically damaging [target] without their consent is wrong. (*MCE3*)
4. Re-programming [target] without their consent is wrong. (*MCE4*)
5. Torturing [target] is wrong. (*MCE5*)
6. The welfare of robots like [target] is one of the most important social issues in the world today. (*MCE6*)

Specific positive (patency) and negative (agency) rights

As part of a change in how society regulates AI, experts in moral philosophy, AI, and law are debating legal frameworks that would entitle [target] to certain legal rights. Below, we list the rights that [target] could be given.

To what extent would you agree or disagree with [target] being given the following rights?

sliding scale: 1 = strongly disagree, 7 = strongly agree

1. [Target] has the right to vote in elections. (*vote_neg*)
2. [Target] has the right to own property. (*property_neg*)
3. [Target] is allowed to engage in financial transactions. (*money_neg*)
4. [Target] is allowed to enter into legal contracts. (*contracts_neg*)

5. [Target] has the right to choose their own job. (*job_neg*)
6. [Target] has legal status to act like how corporations can act as legal persons. (*legal_neg*)
7. [Target] has legal status to be protected like how humans are protected as natural persons. (*legal_pos*)
8. [Target] is allowed to copyright the work they produce. (*copyright_pos*)
9. [Target] is paid by their employer for the work they do. (*remuneration_pos*)
10. [Target] has the right to give consent before they are re-programmed. (*consent_pos*)
11. [Target] has the right to give consent before they are shut down. (*shutdown_pos*)
12. [Target] has the right to be protected from cruel treatment by developers and users. (*cruelty_pos*)

Reciprocity

To what extent could [target] behave in the following ways?

sliding scale: 0 = not at all, 100 = very much

1. [target] goes out of their way to help somebody who has been kind to them before.
2. If someone asks [target] politely for information, [target] is really happy to help them.
3. If someone does a favor for [target], [target] is ready to return it.
4. The way [target] treats others depends on how they treat [target].
5. If somebody is impolite to [target], [target] becomes impolite.
6. If somebody offends [target], [target] will offend them back.

Intrinsic Moral Worth

To what extent would you endorse the following statements about [target]?

sliding scale: 0 = not at all, 100 = very much

1. [target] is a person.
2. [target] has a soul.
3. [target] has an inner essence.
4. [target] is worthy of moral care.
